

Composition and Method for Enhancing Fibrinolysis

Abstract

5 The present invention relates to a novel alpha-2-antiplasmin-binding
molecules and treatment for pulmonary embolism, myocardial infarction,
thrombosis or stroke in a patient which comprises administering an alpha-2-
antiplasmin-binding molecule capable of preventing inhibition of plasmin by
endogenous alpha-2-antiplasmin. The invention also relates to a treatment for
10 pulmonary embolism, myocardial infarction, thrombosis or stroke in a patient
comprising coadministering an alpha-2-antiplasmin-binding molecule of the
invention together with a thrombolytic agent.
